

Question workflow

Workflows:

- Bounded context: "Question "
 - Workflow: "Add question"
 - Triggered by: "User profile"
 - Input: "Question form" (Title, body, tags)
 - Other inputs (validation of the text via ML)
 - Output: "New question accepted"
 - Side effects: User is being notified

Workflows documentation:

- Workflow: "Add question"
- Input: "Question form"
- Output: "New question accepted"

1)Complete question form

2)Review question to see if contains inadequate words

If form is invalid then stop

3)Send notification to confirm the question created

4) return „New question accepted” event

- Substep: "Validate question form"
 - Input: "Invalidated question form"
 - Output: "Validated question form"
 - Dependencies: "Confirmation message"
- Validate title content
- Validate body content
- If all validations are passed then
 - Return validate question form
 - User gets confirmation message
- Else
 - Return validation error

- Propose question for manual review
